

ZERO TRUST NETWORK PROTECTION

Zero-Click Employee Security – Made **Simple** with **Timus SASE**

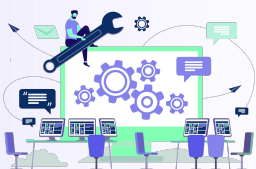

Why SMBs Need Zero Trust Security

Small and mid-sized businesses (SMBs) are prime targets for ransomware. Timus SASE protects users, their devices and company data with a virtual office perimeter, no matter where they are.

Protection From Cyberthreats

Users and their devices are thoroughly verified and can access only what they are allowed. Threat actors are easily thwarted with zero trust checks like impossible travel, geofencing, new device, or time of day.

Zero-Click User Experience

The **always-on** nature of Timus SASE means users will always, no matter what, be securely connected to the corporate network on their company devices – with zero interaction needed.

Virtual Office Perimeter

No matter where your employees are, no matter what networks they are on, **Timus keeps users connected** to the encrypted corporate network – whether at home, in the office, or traveling.

Safely Browse the Web

Timus SASE's URL-based web filtering makes sure that employees can safely browse any content on the web, while the company can make sure only allowed websites can be visited.

Bolster Compliance

Timus SASE enables robust automated insights and reports about your network and user behavior so that you can bolster compliance to regulations including insurance.
